Abstract

Healthcare acquired infections (HAI) are important problem in medical centers, but comprehensive data on their frames and trends are lacking.

Methods

The Takestan Infection Control Team presents its findings in 1394 and 1395. Emphasis on personnel’s education and keen documentation performed meanwhile.

Results

In ٤٩٣١ inpatients were surveyed; infections were found, compared to in ٥٩٣١, ($p<0.05$). There was increased prevalence of urinary tract infection (UTI) and pneumonia.

Conclusion

Between 1395 and 1396 HAI reported prevalence increased by 1.39% in Takestan hospital mostly due to increases in pneumonia and urinary tract infection. This is close to international pattern of nosocomial infections reported by WHO and CDC. Following correct patterns would lead to more effective case finding in nosocomial infection surveys.
میزان عفونتهای بیمارستانی گزارش شده در بیمارستان تاکستان طی سال به میزان % افزایش داشت که عددتاً در عفونتهای ادراری و تنفسی بوده و با الگوی جهانی ارائه شده از مرافکت بین المللی همکاری دارد. پیروی از الگوی صحیح توزیع عفونتهای بیمارستانی به بیماری‌های موثور می‌انجامد.
